RAFINESQUE'S TYPES OF UNIO.

BY E. G. VANATTA.

Mr. C. A. Poulson, in *A Monograph of the Fluviatile Bivalves of the Ohio River, Translated from the French of Prof. C. S. Rafinesque, Philadelphia* (1832), p. v, states that he has "most of the shells described" by Prof. Rafinesque in the *Monographie des Coquilles Bivalves Fluviatiles de la Riviere Ohio*.¹ These shells are now in the collection of The Academy of Natural Sciences of Philadelphia, with Rafinesque's original labels and ink numbers on the specimens. These numbers are the same as those in Prof. Rafinesque's Monograph of 1820.

The fractions given by Rafinesque after each species indicate at what point upon the shell a given dimension is found. The figured species agree well with the types or specimens in hand.

As some of Rafinesque's names are now in use, I believe it will be of interest to determine by what names these shells are known at the present time and the effect on nomenclature if they were recognized and the names dated from 1820.

Many of Rafinesque's species have been credited to Conrad by Mr. C. T. Simpson.²

Dr. H. A. Pilsbry, to whom this paper has been submitted, suggests that it should be explicitly stated that the use of a Rafinesquian name depends upon whether it could be identified by descriptions published prior to any other recognizable name for the same species. That it can be recognized from the types or other specimens from Rafinesque does not entitle his names to acceptance unless the published descriptions are adequate. This question of the adequacy of published diagnoses must be considered for each species separately. It is not taken up in this paper, which deals merely with the question of the identity of the Rafinesque-Poulson specimens.
